College	VIT Chennai

1. Consider a case, a folder has multiple files and how would you copy it to destination machine path (Using SCP and CP options in linux)

SCP : For transferring or copying files/directories between two different hosts

CP : For transferring or copying files/directories in the same host device.

SCP :

In Kali Linux Side (host 1) :

```
(kali㉿kali)-[~/Desktop]

2. Host a FTP and SFTP server and try put and get operation

FTP : File transfer protocol to share files between devices

SFTP : FTP with SSH protocol to securely share files between devices

FTP :

Following these steps to create a FTP Server on my Linux Mint machine

1. `sudo apt install vsftpd`
2. `sudo systemctl enable vsftpd`
3. `sudo nano /etc/vsftpd.conf`
4. `chroot_local_user=YES, write_enable=YES, user_sub_token=$USER,`
`local_root=/home/$USER/ftp, pasv_min_port=10000, pasv_max_port=10100,`
`userlist_enable=YES, userlist_file=/etc/vsftpd.userlist, userlist_deny=NO,`
`force_local_data_ssl=YES, force_local_logins_ssl=YES`

`rsa_cert_file=/etc/ssl/private/vsftpd.pem`
`rsa_private_key_file=/etc/ssl/private/vsftpd.pem`
`ssl_enable=YES`
5. `sudo ufw allow from any to any port 20, 21, 10000:10100 proto tcp`
6. `sudo adduser phil`
7. `sudo mkdir /home/phil/ftp`
8. `sudo chown nobody:nogroup /home/phil/ftp`
9. `sudo chmod a-w /home/phil/ftp`
10. `sudo mkdir /home/phil/ftp/upload`
11. `sudo chown phil:phil /home/phil/ftp/upload`
12. `echo "My FTP Server Tkgowtham" | sudo tee /home/phil/ftp/upload/demo.txt`
13. `echo "phil" | sudo tee -a /etc/vsftpd.userlist`
14. `sudo systemctl restart vsftpd`

```

tkgowtham@tkgowtham-VirtualBox:~/Desktop$ sudo systemctl status vsftpd
● vsftpd.service - vsftpd FTP server
   Loaded: loaded (/lib/systemd/system/vsftpd.service; enabled; vendor preset: enabled)
   Active: active (running) since Fri 2025-02-28 12:21:50 IST; 24min ago
     Main PID: 914 (vsftpd)
        Tasks: 1 (limit: 3428)
       Memory: 1.1M
          CPU: 12ms
      CGroup: /system.slice/vsftpd.service
              └─914 /usr/sbin/vsftpd /etc/vsftpd.conf

Feb 28 12:21:50 tkgowtham-VirtualBox systemd[1]: Starting vsftpd FTP server...
Feb 28 12:21:50 tkgowtham-VirtualBox systemd[1]: Started vsftpd FTP server.
tkgowtham@tkgowtham-VirtualBox:~/Desktop$

```

In Kali Linux (Device 2) :

1. Open a terminal, and type ftp <ip-addr>
2. Type lcd to change directory
3. Use get for downloading a file or mget to download multiple files
4. Use put for uploading a file or mput to upload multiple files

```

(kali@kali)~[~/Desktop]
$ ftp 192.168.1.9
Connected to 192.168.1.9.
220 (vsFTPd 3.0.5)
Name (192.168.1.9:kali): tkgowtham_ftp
331 Please specify the password.
Password:
230 Login successful.
Remote system type is UNIX.
Using binary mode to transfer files.
ftp> lpwd
Local directory: /home/kali/Desktop
ftp> pwd
Remote directory: /
ftp> ls
229 Entering Extended Passive Mode (|||10066|)
150 Here comes the directory listing.

226 Directory send OK.

```

PUT Command :

```
ftp> put ~/Desktop/output.txt output_new.txt
local: /home/kali/Desktop/output.txt remote: output_new.txt
229 Entering Extended Passive Mode (|||10019|)
150 Ok to send data.
100% |*****
226 Transfer complete.
374 bytes sent in 00:00 (1.23 KiB/s)
ftp> █
```

GET Command :

```
ftp> get your-image.jpg
local: your-image.jpg remote: your-image.jpg
229 Entering Extended Passive Mode (|||10016|)
150 Opening BINARY mode data connection for your-image.jpg (52092 bytes).
100% |*****
226 Transfer complete.
52092 bytes received in 00:00 (8.81 MiB/s)
```

SFTP :

Create SFTP Server on Linux Mint (Device 1)

1. sudo apt install ssh
2. sudo systemctl start ssh
3. sudo addgroup sftp
4. sudo adduser sftp_tkgowtham
5. sudo usermod -a -G sftp sftp_tkgowtham
6. Verify using : grep sftp /etc/group
7. sudo mkdir -p /var/sftp/Files
8. sudo chown root:root /var/sftp
9. sudo chmod 755 /var/sftp

10. `sudo chown sftp_tkgowtham:sftp_tkgowtham /var/sftp/Files`

11. `sudo nano /etc/ssh/sshd_config`

12. Add following script to the config file:

Match User sftp_tkgowtham

ChrootDirectory /var/sftp

X11Forwarding no

AllowTcpForwarding no

ForceCommand internal-sftp

13. `sudo systemctl restart ssh`

```
tkgowtham@tkgowtham-VirtualBox:~/Desktop$ sudo systemctl status ssh
● ssh.service - OpenBSD Secure Shell server
   Loaded: loaded (/lib/systemd/system/ssh.service; enabled; vendor preset: enabled)
   Active: active (running) since Fri 2025-02-28 12:21:52 IST; 42min ago
     Docs: man:sshd(8)
           man:sshd_config(5)
  Main PID: 950 (sshd)
    Tasks: 1 (limit: 3428)
   Memory: 3.4M
      CPU: 196ms
   CGroup: /system.slice/ssh.service
           └─950 "sshd: /usr/sbin/sshd -D [listener] 0 of 10-100 startups"

Python-3.10.11.tgz  Templates      Videos          Warpinator       format_for_assignment.txt  snap
sftp> ll
dbs      demo.txt      encrypt.txt  ism4      ISM_Lab.txt  keylogger.py  large-image.jpg  log1      Test      your-image.jpg
decrypt.txt  encrypt_text.txt  extract.txt  ISM_Lab   ISM_Lab.zip  keylog.txt    large_text.txt   output.txt  test.zip  zz.txt
sftp> lpwd
Local working directory: /home/kali/Desktop
sftp> pwd
Remote working directory: /home/tkgowtham
sftp>
```

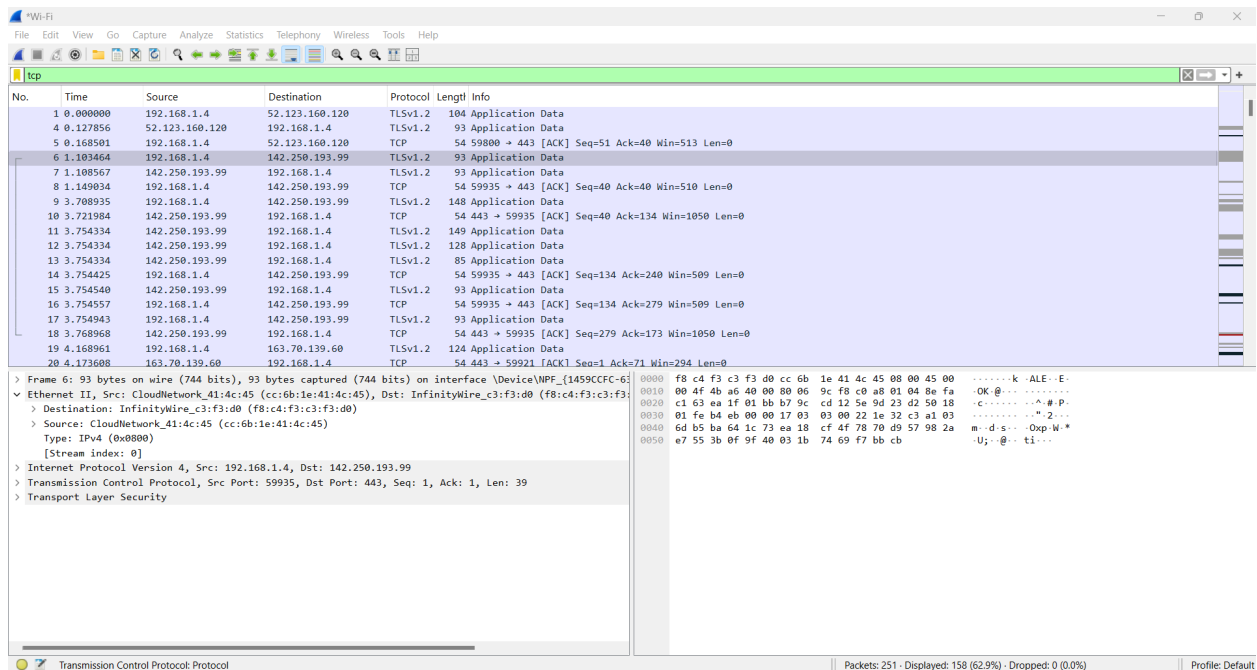

```
sftp> get script.sh
Fetching /home/tkgowtham/Desktop/script.sh to script.sh
script.sh
sftp> █
```

```
sftp> put large-image.jpg
Uploading large-image.jpg to /home/tkgowtham/Desktop/large-image.jpg
large-image.jpg
sftp> █
```

3. Explore with Wireshark, TCP Dump and Cisco Packet Tracer and learn about packet filters

Wireshark : It is a GUI based Packet analyzer which can be used for deep packet analysis with visualization. It captures packets in real time. It supports thousands of protocols and is heavy on resources.

Filters such as tcp, udp, ip, arp, http, and many more can be used, like `tcp.port == 80`.

TCP Dump : It is a CLI based packet analyzer and it is used for light weight resources and capturing and logging. It supports textual protocols and it best for packet capturing and remote troubleshooting.

For filtering it used berkeley packet filter. Eg :

`Tcpdump -i eth0` → capture all packets on eth0

`Tcpdump -i eth0 tcp`

`Tcpdump -i eth0 udp`

`Tcpdump -i eth0 icmp`

`Tcpdump -i eth0 host <ip-addr>`

`Tcpdump -i eth0 port <port-no>`

```
tkgowtham@tkgowtham-VirtualBox:~/Desktop
tkgowtham@tkgowtham-VirtualBox:~/Desktop$ sudo tcpdump -i enp0s3 tcp
tcpdump: verbose output suppressed, use -v|-vv|-vvn for full protocol decode

```

Cisco Packet Tracer : It is a network simulator used for creating network topology simulation and testing. It is a GUI and doesn't support real time packet filtering. It can simulate how a packet travels between devices.

You can create a topology and create a vlan or access control list to filter the packets

4. Understand linux utility commands ping and arp and understand each parameters of ifconfig output

Ping: Used to test network connectivity between two devices

options :

- c No of packet count
- i interval time between packet
- s set packet size
- t set ttl for packet

```
tkgowtham@tkgowtham-VirtualBox:~/Desktop$ ping 192.168.1.3 -c 4
PING 192.168.1.3 (192.168.1.3) 56(84) bytes of data.
64 bytes from 192.168.1.3: icmp_seq=1 ttl=64 time=2493 ms
64 bytes from 192.168.1.3: icmp_seq=2 ttl=64 time=1475 ms
64 bytes from 192.168.1.3: icmp_seq=3 ttl=64 time=451 ms
64 bytes from 192.168.1.3: icmp_seq=4 ttl=64 time=270 ms

--- 192.168.1.3 ping statistics ---
4 packets transmitted, 4 received, 0% packet loss, time 3042ms
rtt min/avg/max/mdev = 270.381/1172.196/2492.878/890.143 ms, pipe 3
tkgowtham@tkgowtham-VirtualBox:~/Desktop$
```

Arp: It is address resolution protocol used for manipulating the ARP table, mapping IP address to MAC address. It is used for troubleshooting network issues.

Options :

- a show all arp entries
- n display numeric ip address
- d delete a entry

```
tkgowtham@tkgowtham-VirtualBox:~/Desktop$ arp -a
_gateway (192.168.1.1) at f8:c4:f3:c3:f3:d0 [ether] on enp0s3
? (192.168.1.3) at 70:5f:a3:61:85:d3 [ether] on enp0s3
? (192.168.1.10) at 08:00:27:c7:e1:36 [ether] on enp0s3
tkgowtham@tkgowtham-VirtualBox:~/Desktop$
```

ifconfig: Used for checking the network interface

interface : eth0 - Name of the network interface

Status flags : UP, BROADCAST, RUNNING, MULTICAST

MTU :Maximum transfer unit of the largest packet size

inet : IPv4 address

inet6 : IPv6 address

subnet mask : network portion of the ip address

MAC address : address of NIC card.

Transmit queue length : the number of packets waiting to be sent

Packet Statistics : RX and TX packets, bytes, errors, dropped and overruns

```

tkgowtham@tkgowtham-VirtualBox:~/Desktop$ ifconfig
enp0s3: flags=4163<UP,BROADCAST,RUNNING,MULTICAST> mtu 1500
    inet 192.168.1.9 netmask 255.255.255.0 broadcast 192.168.1.255

    RX errors 0 dropped 0 overruns 0 frame 0
    TX packets 24128 bytes 2661009 (2.6 MB)
    TX errors 0 dropped 0 overruns 0 carrier 0 collisions 0

lo: flags=73<UP,LOOPBACK,RUNNING> mtu 65536
    inet 127.0.0.1 netmask 255.0.0.0
    inet6 ::1 prefixlen 128 scopeid 0x10<host>
    loop txqueuelen 1000 (Local Loopback)
    RX packets 1294 bytes 157943 (157.9 KB)
    RX errors 0 dropped 0 overruns 0 frame 0
    TX packets 1294 bytes 157943 (157.9 KB)
    TX errors 0 dropped 0 overruns 0 carrier 0 collisions 0

```

5. Understand what happens when a duplicate IP is configured in a network.

When two IP addresses are duplicated in a network, there will be an IP conflict leading to network instability. Because of this, packets may get dropped, misrouted and fail to reach their destination and the address resolution protocol (ARP) table may have incorrect MAC address mappings.

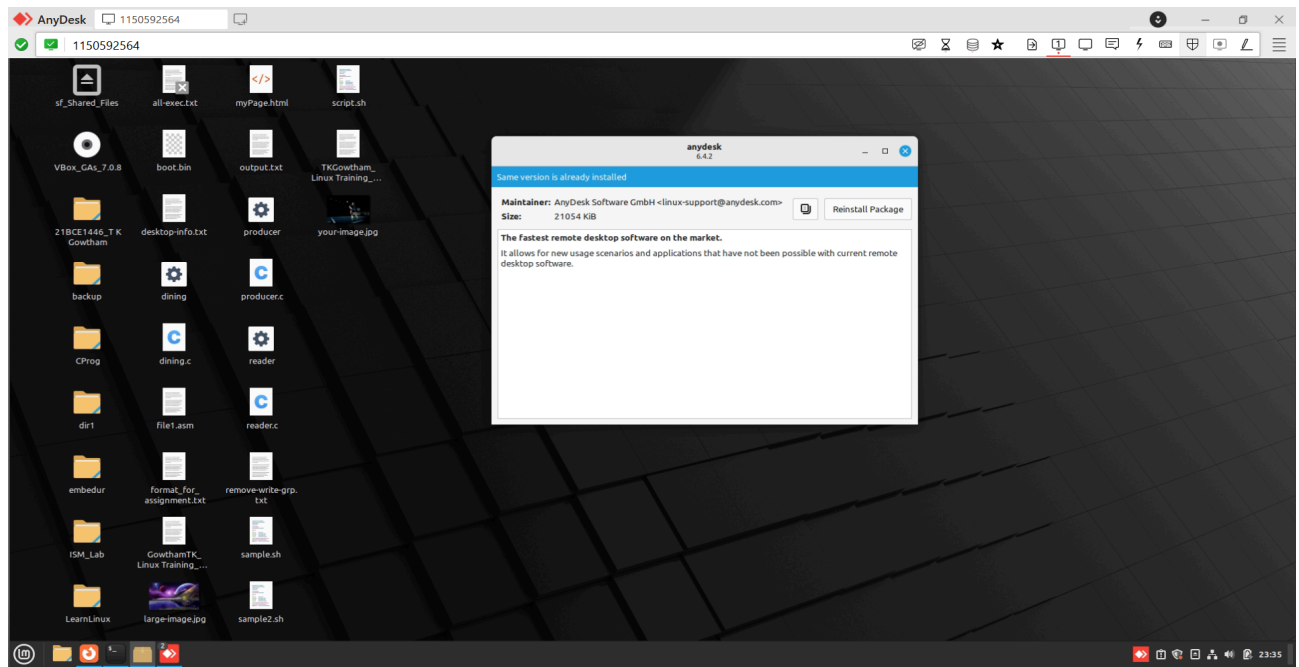

To detect this use `arp -a` command to check if there is any duplicate IP and monitor the system logs.

6. Understand how to access remote systems using RDC, VNC Viewer, Anydesk and teamviewer.

AnyDesk :

AnyDesk is a fast and lightweight remote desktop tool with low latency. It works across Windows, Linux, macOS, and mobile devices via the internet. Users connect using a unique 9-digit address without complex setup. It supports file transfers, unattended access, and session recording.

(Accessing Linux Mint VM via AnyDesk)

Remote Desktop Connection : RDC is a built-in Windows tool for remote access over a LAN or VPN. It requires enabling Remote Desktop on the target PC and knowing its IP. Users can connect using mstsc.exe and enter login credentials. It works only on Windows and does not support cross-platform access.

VNC Viewer : VNC (Virtual Network Computing) allows remote desktop control across platforms. It requires installing a VNC server on the remote machine and a viewer on the client. Connections use IP addresses and work best within the same network (LAN). It is open-source and widely used for Linux, but setup is complex.

Team Viewer : TeamViewer is a powerful remote access tool used for IT support and collaboration. It connects devices via a Partner ID and password, working over the internet. Supports features like chat, file sharing, multi-user access, and meetings. It is free for personal use but requires a license for commercial purposes.

7. How to check if your default gateway is reachable or not and understand the default gateway.

To check if the default gateway is accessible or not use :

```
ip route | grep "default"
```

```
ping <ip_addr>
```

use the command `ip route | grep "default"` to identify the default route and then verify connectivity by pinging the gateway using `ping <ip_addr>` and the default gateway acts as the primary route for forwarding traffic from the local network to external networks, such as the internet.

```
tkgowtham@tkgowtham-VirtualBox:~$ ip route | grep "default"
default via 192.168.1.1 dev enp0s3 proto dhcp metric 100
tkgowtham@tkgowtham-VirtualBox:~$ ping 192.168.1.1 -c 4
PING 192.168.1.1 (192.168.1.1) 56(84) bytes of data.
64 bytes from 192.168.1.1: icmp_seq=1 ttl=64 time=17.5 ms
64 bytes from 192.168.1.1: icmp_seq=2 ttl=64 time=7.17 ms
64 bytes from 192.168.1.1: icmp_seq=3 ttl=64 time=25.0 ms
64 bytes from 192.168.1.1: icmp_seq=4 ttl=64 time=22.5 ms

--- 192.168.1.1 ping statistics ---
4 packets transmitted, 4 received, 0% packet loss, time 3006ms
rtt min/avg/max/mdev = 7.166/18.048/25.024/6.841 ms
tkgowtham@tkgowtham-VirtualBox:~$
```

8. Check `ifconfig` and `iwconfig` and understand about network interfaces.

`ifconfig` is used for managing network interface in wired (ethernet) and loopback

Flags is the interface status flags

MTU defines the largest packet size that a network interface can send.

To check interface speed use `ethtool eth0`

netmask for setting subnet mask

broadcast for setting broadcast address.

Inet is IPv4 address and inet6 is IPv6 address.

Ether <> specifies the MAC address

Rx packets is received packets

TX packets is transmitted packets

```

tkgowtham@tkgowtham-VirtualBox:~$ ifconfig
enp0s3: flags=4163<UP,BROADCAST,RUNNING,MULTICAST> mtu 1500
    inet 192.168.1.9 netmask 255.255.255.0 broadcast 192.168.1.255
    inet6 2401:4900:1c28:6d29:7eb1:34c9:207:8781 prefixlen 64 scopeid 0x0<global>
    inet6 fe80::f18b:36e7:d6d6:337f prefixlen 64 scopeid 0x20<link>
    inet6 2401:4900:1c28:6d29:5865:2030:260:4e40 prefixlen 64 scopeid 0x0<global>
    ether 08:00:27:d8:25:4b txqueuelen 1000 (Ethernet)
    RX packets 21724 bytes 30522718 (30.5 MB)
    RX errors 0 dropped 0 overruns 0 frame 0
    TX packets 7185 bytes 731626 (731.6 KB)
    TX errors 0 dropped 0 overruns 0 carrier 0 collisions 0

lo: flags=73<UP,LOOPBACK,RUNNING> mtu 65536
    inet 127.0.0.1 netmask 255.0.0.0
    inet6 ::1 prefixlen 128 scopeid 0x10<host>
    loop txqueuelen 1000 (Local Loopback)
    RX packets 419 bytes 51769 (51.7 KB)
    RX errors 0 dropped 0 overruns 0 frame 0
    TX packets 419 bytes 51769 (51.7 KB)
    TX errors 0 dropped 0 overruns 0 carrier 0 collisions 0

```

iwconfig is used for managing network interfaces in wireless configuration.

IEEE 802.11bgn → IEEE WiFi standard
 ESSID → Network name
 Mode → Connected to an access point
 Frequency → Operating Wifi Frequency
 Access Point → MAC Address
 Bit rate → current data transfer speed
 Tx power → Transmission power level
 Retry long limit → maximum retry before failure
 RTS thr → Request to send
 Fragment → packet fragmentation
 Power Management → power saving mode
 Link Quality → signal strength
 Signal level → wifi signal strength
 Rx → Received packet info
 Tx → Transmitted packet related info

```
sssit@JavaTpoint: ~  
sssit@JavaTpoint:~$ iwconfig  
lo          no wireless extensions.  
  
wlan0       IEEE 802.11bgn  ESSID:"NETGEAR64"

Rx invalid nwid:0   Rx invalid crypt:0   Rx invalid frag:0  
Tx excessive retries:0 Invalid misc:8   Missed beacon:0  
  
eth0        no wireless extensions.  
  
sssit@JavaTpoint:~$
```

(Sample image of iwconfig since I don't have wireless network connected to my VM)

9. Log in to your home router's web interface (usually at 192.168.1.1 or 192.168.0.1) and check the connected devices list.

The screenshot shows the Dragon Path Technologies web interface. The top navigation bar includes links for Status, LAN, WLAN, WAN, Services, VoIP, Advance, and Admin. The 'LAN' tab is selected. On the left sidebar, there are sections for 'Status' (with sub-links for Device, Local Devices, IPv6, PON, and VoIP) and 'Statistics' (with a link for Diagnostics). The main content area is titled 'LAN User List' and includes a subtitle: 'This table shows a list of active devices connected to the LAN Network.' Below this is a table with the following data:

Hostname	Interface	IP Address	MAC Address	IP Address Allocation	Lease Remaining(secs)
tkgowtham-VirtualBox	Wireless(5GHz)	192.168.1.9	cc:6b:1e:41:4c:45	DHCP	83586
	Wireless(2.4GHz)	192.168.1.8	16:79:98:6c:76:d3	DHCP	85048
Gowtham-s-M33	Wireless(2.4GHz)	192.168.1.7	6e:43:7d:36:c3:78	DHCP	56230
DESKTOP-0VU859A	Wireless(5GHz)	192.168.1.4	cc:6b:1e:41:4c:45	DHCP	86325

Below the table is a 'Refresh' button.

10. Explain how a DHCP server assigns IP addresses to devices in your network.

A DHCP server assigns IP addresses using the DORA (Discover, Offer, Request, Acknowledge) process:

1. The client broadcasts a DHCP Discover request to find a DHCP server.
2. The server responds with a DHCP Offer, providing an available IP address.

3. The client sends a DHCP Request to accept the offered IP.
4. The server sends a DHCP Acknowledgement (ACK), confirming the assignment and leasing the IP to the device.

11. Using a terminal, connect to a remote machine via ssh and telnet.

SSH is secure shell service which is encrypted and secure and connects to a remote machine's shell

ex: ssh username@ip-addr

Telnet is an unencrypted protocol and is insecure and not used often now.

ex : telnet remote-ip

```
tkgowtham@tkgowtham-VirtualBox:~$ ssh vboxuser@192.168.1.10
The authenticity of host '192.168.1.10 (192.168.1.10)' can't be established.
ED25519 key fingerprint is SHA256:MNLBuBZe9JGRkkwMtlbRnMlagrwouR9Lj2q4Y+ufJrA.
This key is not known by any other names
Are you sure you want to continue connecting (yes/no/[fingerprint])? yes

Welcome to Ubuntu 22.04.5 LTS (GNU/Linux 6.8.0-52-generic x86_64)

 * Documentation:  https://help.ubuntu.com
 * Management:    https://landscape.canonical.com
 * Support:       https://ubuntu.com/pro

Expanded Security Maintenance for Applications is not enabled.

34 updates can be applied immediately.
24 of these updates are standard security updates.
To see these additional updates run: apt list --upgradable

Enable ESM Apps to receive additional future security updates.
See https://ubuntu.com/esm or run: sudo pro status

The programs included with the Ubuntu system are free software;
the exact distribution terms for each program are described in the
individual files in /usr/share/doc/*/copyright.

Ubuntu comes with ABSOLUTELY NO WARRANTY, to the extent permitted by
applicable law.

vboxuser@Ubuntu:~$
